FLOWCRETE AMERICAS DISCOVERS THE JOY OF SCIENCE AT LITTLE BEAKERS

► Flowcrete Americas has been involved in a playful flooring project at one of North West Houston's must-see attractions, Little Beakers.

► Flowtallics is one of Flowcrete Americas' most popular materials, installed by experienced craftsmen to deliver a one-of-a-kind floor finish that can never be recreated.

▶▶ Flowcrete Americas has been involved in a playful flooring project at one of North West Houston's must-see attractions, Little Beakers.

Little Beakers - the brainchild of Cinttya Morgan, a highly decorated materials chemist - is a real science lab, built for young budding scientists, offering science learning and family fun for children of all ages.

Any kid who likes to play, experiment and create new and fun things will enjoy the Little Beakers open play science lab experience, based conveniently between two major highways in Cypress, TX.

Here, they can mix, bubble, and create the day away with up to 30 experiments to enjoy at six different lab stations. This includes mirroring the reaction found in a bubbling, active volcano and discovering the physical effects of tornados, explosions and rockets.

When children arrive, they are given their very own lab coat, safety glasses and all the super fun

equipment and playful ingredients they need to conduct any experiment they choose.

Parents are more than welcome to join in too and for those really little beakers there is a clean and carpeted toddler zone play area with toys just for them - with mini microscopes and toddler friendly telescopes, magnets, giant molecules and chalk boards.

Flowcrete Americas was delighted to be involved in floor renovation works at this local attraction in conjunction with longstanding applicator partner, Texas Seamless Floors.

Here, more than 2,000 sq ft of Flowcrete Americas' Flowtallics material was installed across the laboratory floor in a decorative shade of Blue Lagoon.

Flowtallics is one of Flowcrete Americas' most popular materials, installed by experienced craftsmen to deliver a one-of-a-kind floor finish that can never be recreated.

Containing metallic pigments, the polymer floor material is installed seamlessly in-situ using specialist application techniques to create a dramatic swirled pattern across the surface of the floor.

Aside from its decorative appearance, the Flowtallics material is incredibly robust, offering an excellent chemical resistant, slip resistant and stain resistant platform to handle all of the spillages that come hand in hand with the young scientist's experiments.

As a result, the material is a great choice for retail spaces, restaurants, arcades, hotel lobbies and other leisure venues.

A new addition to the Flowtallics family, Flowtallics UV - a 100% UV light and color stable version - is now available.

Flowtallics and Flowtallics UV are available in thicknesses ranging from 30 – 35 mils and in eight decorative shades including Blue Lagoon, Coffee, Merlot and Mojito.
